JOHNSON, BRIAN P.

ART UNIT	PAPER NUMBER
----------	--------------

2183

DATE MAILED: 09/21/2006

Please find below and/or attached an Office communication concerning this application or proceeding.

<b>Office Action Summary</b>	<b>Application No.</b> 10/797,886	<b>Applicant(s)</b> SAHA, BRATIN	
	<b>Examiner</b> Brian P. Johnson	<b>Art Unit</b> 2183	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

#### Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

#### Status

- 1) ☒ Responsive to communication(s) filed on 05 July 2006.
- 2a) ☐ This action is **FINAL**.                      2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

#### Disposition of Claims

- 4) ☒ Claim(s) 1-34 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 1-34 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

#### Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on \_\_\_\_\_ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

#### Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All    b) ☐ Some \*    c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
  2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
  3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

1. Claims 1-34 have been examined.

Acknowledgment of papers filed: amendments and remarks on 05 July 2006.

The papers filed have been placed on record.

### ***Specification***

2. The title is accepted. Objection is withdrawn.

### ***Claim Objections***

3. Claim 26 is objected to because of the following informalities: in the final line, perhaps the word "affect" is more appropriate than "effect". Please consider similar claims in light of this objection. Appropriate correction is required.

### ***Claim Rejections - 35 USC § 101***

4. Rejection is withdrawn.

### ***Claim Rejections - 35 USC § 102***

5. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

6. Claims 11, 12, 15, 16, 17, and 20 are rejected under 35 U.S.C. 102(b) as being anticipated by Rajwar (Speculative Lock Elision).

7. Regarding claim 11, Rajwar discloses a machine-implemented method comprising: generating parallel processes in a data processing machine (Rajwar page 294 col 1 section 1); effecting synchronization between the parallel processes using processor speculation in the data processing machine (Rajwar page 295 col 1) to speculatively read-modify-write a lock variable associated with a critical section (Rajwar page 295 col 1); and providing output resulting from the synchronized parallel processes (Rajwar page 294 col 2 second paragraph).

*Note the use of a store instruction. This is considered to be a readable output.*

8. Regarding claim 12, Rajwar discloses the method of claim 11, wherein said generating parallel processes comprises running a software program (Rajwar page 294 figure 1) that spawns multiple threads in the data processing machine (Rajwar page 294 section 1 col 1).

9. Regarding claim 15, Rajwar discloses the method of claim 11, wherein said providing output comprises sending the output to another data processing machine (Rajwar page 294 section 1 col 1).

*Note that the store instructions within a processor stores data to memory. This output is then picked up by another processor in the "shared memory multiprocessors" disclosed in Rajwar.*

10. Regarding claim 16, Rajwar discloses an article comprising a machine-readable storage medium embodying information indicative of instructions that when performed by one or more machines result in operations (Rajwar page 294 col 2 fig 1)

*Note that clearly, the instructions disclosed in figure 1 must be contained on a computer readable medium for the processing system to execute the instructions.*

Comprising: generating parallel processes in a data processing machine (Rajwar page 294 col 1 section 1); effecting synchronization between the parallel processes using processor speculation in the data processing machine to speculatively read-modify-write a lock variable associated with a critical section (Rajwar page 295 col 1); and providing output resulting from the synchronized parallel processes (Rajwar page 294 col 2 "store instruction").

11. Regarding claim 17, Rajwar discloses the article of claim 16, wherein said generating parallel processes comprises running a software program that spawns multiple threads in the data processing machine (Rajwar page 294 section 1 col 1).

Art Unit: 2183

12. Regarding claim 20, Rajwar discloses the article of claim 16, wherein said providing output comprises sending the output to another data processing machine (Rajwar page 294 section 1 col 1).

*Note: see claim 15*

13. Claims 11, 15, 16, and 20 are rejected under 35 U.S.C. 103(a) as being unpatentable over Transactional Memory (herein Moss).

14. Regarding claim 11, Moss discloses a machine-implemented method comprising: generating parallel processes in a data processing machine (Moss page 290 sections 2.1 and 2.2); effecting synchronization between the parallel processes (page 289 col 2 "lock-free synchronization") using processor speculation in the data processing machine (Moss page 290 section 2.2) to speculatively read-modify-write a lock variable associated with a critical section (Moss page 289 col 2); and providing output resulting from the synchronized parallel processes (Moss page 290 section 2.1).

*Note the use of a store instruction. This is considered to be a readable output.*

15. Regarding claim 15, Rajwar discloses the method of claim 11, wherein said providing output comprises sending the output to another data processing machine (Rajwar page 294 section 1 col 1).

*Note that the store instructions within a processor stores data to memory. This output is then picked up by another processor in the "shared memory multiprocessors" disclosed in Rajwar.*

16. Regarding claim 16, Moss discloses an article comprising a machine-readable storage medium embodying information indicative of instructions that when performed by one or more machines result in operations (Moss page 290 section 2.1)

*Note that clearly, the instructions disclosed in section 2.1 must be contained on a computer readable medium for the processing system to execute the instructions.*

Comprising: generating parallel processes in a data processing machine (Rajwar page 294 col 1 section 1); effecting synchronization between the parallel processes using processor speculation in the data processing machine to speculatively read-modify-write a lock variable associated with a critical section (Moss page 290 section 2.2); and providing output resulting from the synchronized parallel processes (Moss page 290 section 2.1).

17. Regarding claim 20, Moss discloses the article of claim 16, wherein said providing output comprises sending the output to another data processing machine (Moss page 290 section 2.1).

Note: see claim 15

Art Unit: 2183

18. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

19. Claims 1, 6, 7, 14, and 19 are rejected under 35 U.S.C. 103(a) as being unpatentable over Transactional Memory (herein Moss) in view of Lam (Enhancing Software Reliability with Speculative Threads).

20. Regarding claim 1, Moss discloses a processor (page 289 abstract) comprising:  
a front end that obtains instructions (see below);

*Note that the terms, "front end" and "back end", as vaguely defined are limited only by how the reference is defined. Any portion of the processor can be considered a "front end" or "back end".*

And a back end that provides speculative execution of the instructions (page 290 section 2.2);

Moss also discloses synchronization of parallel processes (page 289 column 2—"lock-free synchronization")

Moss fails to disclose an instruction that follows all claimed limitations.

Lam discloses an instruction set architecture including speculative execution control circuitry that handles at least one machine instruction that facilitates synchronization between parallel processes by exposing the processor speculation to program control (Lam page 187 TRY instruction).

Although it is clear from Moss that synchronization is maintained, it does not describe how the start of the critical section is determined. Lam, however, uses this TRY instruction which "allows the program to recover from attacks that overwrite data structures beyond those expected". Moss would be motivated to use this technique because it gives a large amount of control to the programmer, who can remove unnecessary processor commands (which happened to be the general motivation behind the Moss invention initially). Additionally, for the same motivation, Moss would be motivated to include other elements of lock speculation in an explicit instruction.

It would have been obvious at the time of the invention for one of ordinary skill in the art to allow the processing system of Moss maintain synchronization through explicit instructions such as TRY.

21. Regarding claim 6, Moss/Lam discloses the processor of claim 1, wherein the at least one machine instruction comprises: a speculative execution instruction that takes first and second operands,

*Note that the term "operands" most commonly refers to inputs of an arithmetic operation. Applicant's invention does not use the claimed operands for that purpose. Consequently, Examiner believes it is reasonable to consider the claimed operands to be any register associated to the instruction.*

Behaves as a no-op if a memory location indicated by the first operand contains a first value (Lam page 187 section 3.2),

*Note that the TRY instruction serves no purpose if there is no error.*

Art Unit: 2183

Causes the processor to speculatively execute additional instructions if the memory location contains a second value (Moss page 290 sections 2.1 and 2.2), and causes the processor to start executing instructions from an address indicated by the second operand if a mis-speculation occurs (Lam page 187 TRY instruction);

*Note the {addr} value.*

And a speculation termination instruction that takes first and second operands and causes the processor to begin retiring the additional instructions if the additional instructions have been speculatively executed (Moss page 290 COMMIT instruction).

22. Regarding claim 7, Moss/Lam discloses the processor of claim 6, wherein the mis-speculation comprises an interrupt (Lam page 187 section 3.2 first column).

*Note "error-detected", which will interrupt the speculative execution.*

23. Regarding claim 14, Moss/Lam discloses the method of claim 11, wherein said effecting synchronization comprises placing in an out-of-order execution management unit of a processor (see below),

*Note that the use of speculative lock acquisition is used to facilitate out-of-order execution*

At least one machine instruction that limits when other machine instructions are retired from the out-of-order execution management unit (Moss page 290 COMMIT and ABORT instructions).

Art Unit: 2183

24. Regarding claim 19, Moss/Lam discloses the article of claim 16, wherein said effecting synchronization comprises placing in an out-of-order execution management unit of a processor (see below),

*Note that the use of speculative lock acquisition is used to facilitate out-of-order execution*

At least one machine instruction that limits when other machine instructions are retired from the out-of-order execution management unit (Moss page 290 COMMIT and ABORT instructions).

25. Claims 21-25, 27, and 31-34 are rejected under 35 U.S.C. 103(a) as being unpatentable over Transactional Memory (herein Moss) in view of Lam (Enhancing Software Reliability with Speculative Threads) in view of Rajwar.

26. Regarding claim 21, Moss/Lam discloses a machine-implemented method comprising: speculatively executing machine instructions (Moss page 290 section 2.1), including a memory access instruction (Moss page 290 section 2.1),

*Note the use of load and test instructions.*

In a processing system to effect synchronization between parallel processes (Moss page 289 col 2); retiring the speculatively executed machine instructions (Moss page 290 COMMIT instruction); and maintaining cache coherence in the processing system during said executing and said retiring to identify a mis-speculation to effect the synchronization between the parallel processes (Moss page 290 COMMIT instruction),

Art Unit: 2183

wherein the speculatively executing comprises performing a speculative read-modify-write associated with a critical section (Moss page 289 col 2), retiring the speculatively executed machine instructions (Moss page 290 COMMIT instruction), maintaining cache coherence in the processing system during said executing and said retiring to identify a mis-speculation to effect the synchronization between the parallel processes (Moss page 290 section 2.1).

Moss/Lam fails to disclose that the speculation is to a lock variable.

Rajwar discloses a lock variable speculatively executed (without the lock) and re-executed (with the lock) during a failure (page 295 col 1).

Examine asserts that speculative lock execution can cause deadlocks that cause a program to constantly re-execute information based on critical section contention.

Moss/Lam discloses re-executing instructions during such a contention, but doesn't how this re-execution occurs. Moss/Lam would have been motivated to utilize the lock variable, as shown in Rajwar, to prevent a mistake from repeating itself while still allowing the speculative nature of the critical section.

It would have been obvious at the time of the invention for one of ordinary skill in the art to take the system of Moss/Lam and include a lock variable (as shown in Rajwar) that is attained after a mis-prediction of the speculative execution shown in both Rajwar and Moss/Lam.

27. Regarding claim 22, Moss/Lam/Rajwar discloses the method of claim 21, wherein said maintaining cache coherence comprises providing invalidation based cache coherence (Moss page 290 section 2.1)

28. Regarding claim 23, Moss/Lam/Rajwar discloses the method of claim 21, wherein said speculatively executing machine instructions comprises speculatively executing machine instructions in the processing system comprising multiple processors, and the mis-speculation comprises a memory dependency violation (Moss page 289 Abstract).

29. Regarding claim 24, Moss/Lam/Rajwar discloses the method of claim 21, wherein the mis-speculation comprises at least one of an interrupt (Lam page 187 section 3.2 first column.),

*Note "error-detected", which will interrupt the speculative execution.*

An external event (Lam page 187 section 3.2 first column.),

*Note that the "error-detected" is considered to be external to the speculation logic.*

And a memory dependency violation (Moss page 290 section 2.1).

30. Regarding claim 25, Moss/Lam/Rajwar discloses a system comprising: a processor (Moss page 289 Abstract) having a processor architecture that provides speculative execution of machine instructions (Moss page 290 section 2.2) and exposes

Art Unit: 2183

said speculative execution to program control through at least one machine instruction (Lam page 187 TRY instruction); and a memory coupled with the processor, the memory embodying information indicative of instructions (Moss page 290 section 2.1),

*Note that for these instructions to be read, a memory must be used.*

Including the at least one machine instruction, that result in synchronization between parallel processes when performed by the processor with detection of mis-speculation (Lam page 197 TRY instruction), wherein performance of the instruction by the processor comprises performing a speculative read-modify-write to the lock variable associated with a critical section (MOSS page 289 col 2—in light of Rajwar).

31. Regarding claim 27, Moss/Lam/Rajwar discloses the system of claim 25, wherein the processor comprises a multiprocessor (Moss page 289 Abstract).

32. Regarding claim 31, Moss/Lam/Rajwar discloses the system of claim 25, wherein the at least one machine instruction comprises: a speculative execution instruction (Lam page 187 TRY instruction) that takes first and second operands,

Behaves as a no-op if a memory location indicated by the first operand contains a first value (Lam page 187 section 3.2), causes the processor to speculatively execute additional instructions if the memory location contains a second value (Moss 290 sections 2.1 and 2.2), and causes the processor to start executing instructions from an address indicated by the second operand if a mis-speculation occurs (Lam page 187 TRY instruction); and a speculation termination instruction that causes the processor to

Art Unit: 2183

begin retiring the additional instructions if the additional instructions have been speculatively executed (Moss page 290 COMMIT instruction).

33. Regarding claim 32, Moss/Lam/Rajwar discloses the system of claim 25, further comprising an environmental sensor coupled with the processor (Lam page 187 end of section 3.2).

*Note that the error detection if statement is considered to be an environmental sensor.*

34. Regarding claim 33, Moss/Lam/Rajwar discloses a processing system comprising: processing means for speculatively executing machine instructions in response to a speculative execution instruction (Lam page 187 TRY instruction), including means for detecting a mis-speculation (Moss page 290 COMMIT instruction); means for treating multiple speculative instructions as a group for purposes of retirement such that the multiple speculative instructions are flushed from the processing means together (Moss page 290 COMMIT instruction) and execution proceeds from an address in response to a detected mis-speculation to effect synchronization between parallel processes (Lam page 187 TRY instruction and Moss page 290 COMMIT instruction), wherein performance of the instructions by the processing means comprises performing a speculative read-modify-write to a lock variable associated with a critical section (Moss page 289 col 2—in light of Rajwar).

35. Regarding claim 34, Moss/Lam/Rajwar discloses the processing system of claim 33, wherein said means for detecting a mis-speculation comprises means for maintaining cache coherence in the processing means (Moss page 290 sections 2.1 and 2.2).

36. Claims 2-5, and 8-10 are rejected under 35 U.S.C. 103(a) as being unpatentable over Moss/Lam in view of Christie (U.S. Patent No. 6,009,512).

37. Regarding claim 2, Moss/Lam discloses the processor of claim 1.

Moss/Lam contains an out-of-order processor (as suggested by the speculative lock interface), but fails to disclose particular information about how the out-of-order system works.

Christie discloses a front end that comprises an in-order front end (Christie fig 5), and the back end comprises an out-of-order execution engine (Christie fig 5), which re-orders the instructions (Christie col 6 line 49), and one or more execution units that perform the re-ordered instructions (Christie fig 5 references 1212A-C).

For subsequent claims, Christie also discloses a branch prediction unit.

Examiner asserts that out-of-order execution must start and end in program order, while allowing the execution units execute out-of-order execution. Consequently, an in-order front end with an out-of-order back end, as claimed, is likely an inherent aspect of the invention for Moss/Lam; however, in case Examiner is neglecting to consider an exception, this will be an obvious rejection. Moss/Lam would be motivated

Art Unit: 2183

to utilize an in-order front end with an out-of-order back end, because this is, as one of ordinary skill in the art would have realized, a simple and efficient mechanism for out-of-order processing.

Additionally, Moss/Lam would be motivated to utilize a branch prediction unit. As one of ordinary skill in the art would have realized, a branch prediction unit can cause large performance increases in a processor. An invention such as Moss/Lam with that particular intention in mind would be particularly motivated to utilize this mechanism.

It would have been obvious at the time of the invention for one of ordinary skill in the art for the processing system of Moss/Lam to utilize mechanisms of Christie that were not described in great detail (so not to obscure the invention of Moss/Lam) such as a branch prediction unit and Christie's out-of-order processing setup.

38. Regarding claim 3, Moss/Lam/Christie discloses the processor of claim 2, wherein the out-of-order execution engine comprises an out-of-order execution management unit (Christie fig 5), including at least one buffer (Christie col 7 line 51), and an in-order retire-store unit (Christie col 7 lines 54-64).

39. Regarding claim 4, Moss/Lam/Christie discloses the processor of claim 3, wherein the at least one buffer comprises a reorder buffer (Christie col 7 lines 54-64).

40. Regarding claim 5, Moss/Lam/Christie discloses the processor of claim 1, wherein the front end comprises a fetch-decode unit (see below)

*Note that it is an inherent aspect of the referenced invention to have a fetch-decode unit. In order for the instructions to be processed, they must be fetched and decoded.*

And a branch prediction unit (Christie col 6 line 35).

41. Regarding claim 8, Moss/Lam/Christie discloses a processor comprising: a front end that obtains instructions; and a back end that provides speculative execution of the instructions (Christie fig 5) wherein the processor has an instruction set architecture including speculative execution control circuitry that handles a speculative execution instruction (Moss page 290 sections 2.1 and 2.2) and a speculation termination instruction (Lam COMMIT instruction).

42. Regarding claim 9, Moss/Lam/Christie discloses the processor of claim 8, wherein the front end comprises an in-order front end, and the back end comprises an out-of-order execution engine (Christie Fig 5), which re-orders the instructions (Christie col 6 line 49), and one or more execution units that perform the re-ordered instructions (Christie fig 5 references 1212A-C).

43. Regarding claim 10, Moss/Lam/Christie discloses the processor of claim 8, wherein the speculative execution instruction comprises an instruction that takes first and second operands,

*Note: see claim 6.*

Causes the processor to speculatively execute additional instructions if a memory location contains a value (Lam page 187 section 1 col 1), and causes the processor to start executing instructions from an address indicated by the second operand if a mis-speculation occurs (Lam page 187 col 2 TRY {addr}), and the speculation termination instruction comprises an instruction that causes the processor to begin retiring the additional instructions (Moss page 290 COMMIT instruction).

44. Claims 13 and 18 are rejected under 35 U.S.C. 103(a) as being unpatentable over Rajwar in view of common prior art.

45. Regarding claim 13, Rajwar discloses the method of claim 11.

Rajwar fails to disclose synchronization comprises translating at least one high-level software instruction into at least one machine instruction that controls speculative execution in a processor.

Examiner asserts that the use of a high-level language is extremely common in the art. Rajwar would be motivated to utilize this strategy to simplify the code writing process for a programmer at a high level language, and allow a compiler/assembler put the language in machine code for the processor to read.

It would have been obvious at the time of the invention for one of ordinary skill in the art to take the machine instructions in the processing system of Rajwar, and have them translated from a high-level language.

46. Regarding claim 18, Rajwar discloses the article of claim 16 as well as the remaining limitations. See claim 13 above.

47. Claim 28 is rejected under 35 U.S.C. 103(a) as being unpatentable over Moss/Lam/Rajwar in view of common prior art.

48. Regarding claim 28, Moss/Lam/Rajwar discloses the system of claim 27.

Moss/Lam fails to disclose that the multiprocessors are in a single die.

Examiner asserts that placing multiple processing units on a single die is extremely common in the art and allows for faster, cheaper and more power effective processing systems.

It would have been obvious at the time of the invention for one of ordinary skill in the art to allow all the processors of Moss/Lam to be on a single die.

49. Claim 26 is rejected under 35 U.S.C. 103(a) as being unpatentable over Moss/Lam/Rajwar in view of Rajwar.

50. Regarding claim 26, Moss/Lam discloses the system of claim 25.

Moss fails to disclose the use of a uniprocessor.

Rajwar discloses the use of a multithreaded uniprocessor (page 294 section 1 col

1)

Examiner asserts that Moss/Lam/Rajwar (as initially combined) would be motivated to utilize a multithreaded uni-processor system rather than a multiprocessor system. Examiner asserts that multithreaded systems have been shown to have substantial performance increases without the requirement of multiple processors—saving on area, power, and cost.

It would have been obvious at the time of the invention for one of ordinary skill in the art to implement the system of Moss/Lam as a uniprocessor (as shown in Rajwar)

51. Claims 29 and 30 are rejected under 35 U.S.C. 103(a) as being unpatentable over Moss/Lam/Rajwar in view of common prior art.

52. Regarding claims 29 and 30, Moss/Lam/Rajwar discloses the system of claim 25, further comprising: a communication interface (Rajwar page 294 section 1 col 1);

*Note that the processing system is considered to be a communication interface.*

Moss/Lam/Rajwar (as initially combined) fails to disclose a virtual machine, including a java virtual machine.

Examiner asserts that the use of a java virtual machine in a processing system is extremely common in the art and gives the processing system added security by preventing information inside the machine to be accessed outside the machine. Portability of code is another potential motivation.

It would have been obvious at the time of the invention for one of ordinary skill in the art to allow the system of Moss/Lam/Rajwar utilize a java virtual machine.

### ***Response to Arguments***

53. Applicant's arguments filed 05 July 2006 have been fully considered but they are not persuasive. Other arguments are considered moot under new grounds of rejection.

54. Applicant state:

*"Independent claims 11 and 16 each recite, 'effecting synchronization between the parallel processes using processor speculation in the data processing machine.' Thus, processor speculation is used to bring about synchronization between the parallel processes. IN stark contrast, Rajwar describes systems and techniques for avoiding synchronization altogether."*

Examiner disagrees. The use of lock speculation is not avoiding synchronization for a variety of reasons. 1) Locks are not required for synchronization. This is the entire point of both Applicant's invention and the referenced used for anticipation. Note the use of the term "lock-free synchronization" in Moss. 2) Rajwar does obtain a lock when the speculation is unsuccessful. 3) Applicant "avoids synchronization" in the same sense that Applicant accuses Rajwar of doing the same. If avoiding synchronization should truly be defined as Applicant contends, then Applicant's claims are not appropriately claiming the invention disclosed in Applicant's specification.

55. Applicant states:

*"Claims 11 and 16 have been amended to clarify the claimed subject matter and now recite '...speculatively read-modify-write a lock variable associated with a critical section'...This amendment makes clear that the speculative execution is of the lock acquisition code, not merely the critical section as done in Rajwar."*

Examiner disagrees. The difference is not made clear by this amendment.

Rajwar speculatively executes a critical section (or, in other words, speculatively avoids

Art Unit: 2183

a read-modify-write lock) and, if mis-predicted, re-executes with the lock. This appears to be precisely the same technique is disclosed in Applicant's Fig 5.

56. Applicant states:

*"Lam describes techniques to enhance the reliability of software through the use of monitoring programs executed speculatively in parallel with the main program being monitored...By definition, a monitoring program does not need to synchronize with the main program because the two programs do not need to coordinate their accesses to a shared resource."*

Examiner disagrees. Lam does discuss monitoring functions; however, the "TRY instruction" and exception catching functionality is clearly used to affect synchronization in the ways described in the combination.

57. Applicant states:

*"Rajwar actually teaches away from the proposed combination"*

Examiner agrees. In light of this argument, a new grounds rejection has been made.

### **Conclusion**

58. The following is text cited from 37 CFR 1.11(c): In amending in reply to a rejection of claims in an application or patent under reexamination, the applicant or patent owner must clearly point out the patentable novelty which he or she thinks the claims present in view of the state of the art disclosed by the references cited or the objections made. The applicant or patent owner must also show how the amendments avoid such references or objections.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Brian P. Johnson whose telephone number is (571) 272-2678. The examiner can normally be reached on 8-4:30 M-F.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Eddie Chan can be reached on (571) 272-4162. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300. Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
